Advanced R Programming - Lecture 1

Krzysztof Bartoszek (slides by Leif Jonsson and Måns Magnusson)

Linköping University krzysztof.bartoszek@liu.se

24 August 2020 (Zoom)

Today

- About the course
 - Aim of the course
- Presentation(s)
 - Presentation(s)
- Course Practicals
- 4 Why R?
- Basic R
 - Data structures
 - Logic and sets
 - Subsetting/filtering
 - Functions

Learn to

- Write R programs and packages
- Write performant code
- Learn basic software engineering practices

But most important...

But most important...

Your primary tool for (at least) the next two years

Course Plan

Part 1: R Syntax

Period: Week 1-2

Students work: Individually Lab: Documented R file

Computer lab

Topics

- Basic R Syntax
- Basic data structures
- Program control
- R packages

Part 2: Advanced topics

Period: Weeks 3-7

Students work: In groups

Turn in: R package on GitHub

Seminar,

1 Lab to help GitHub+Travis,

Topics

- Performant code: Writing quality code
- Linear algebra, Object orientation, Graphics
- Advanced I/O
- Performant code: Writing fast code
- Computational complexity
 (with exercise session, BONUS point possibility)

Today

Presentation(s)

Teaching staff for course

Me: Krzysztof Bartoszek, background

- MEng in Computer Science, Gdańsk Univ. of Technology 2007
- MPhil in Computational Biology, Univ. of Cambridge 2008
- PhD in Statistics, Univ. of Gothenburg 2013
- Postdoc, Dept. Mathematics Uppsala Univ. 2013–2017
- Lecturer, STIMA LiU 2017–

Martin Beneš, Oriol Garrobé Guilera, Hao Chi Kiang, Agustin Valencia

- Labs
- Grading
- Support

Evaluation of 2019 course

- 62 students took the course in 2019.
- 2 19 submitted an evaluation.
- 3 Course grade: 3.68 ± 0.89 .
- Ohanges for 2020 based on the evaluation and exam.
 - Obligatory attendance at seminars dropped.
 - Additional material concerning OO programming in R added.

You

- Backgound?
- Why this course?
- Expectations?

Course Practicals...

Course Practicals...

- Course code: 732A94
- https://github.com/STIMALiU/AdvRCourse
- LISAM and emails (Zoom links, submission, materials, messages, exam information)
- https://www.ida.liu.se/~732A94/index.en.shtml (material incl. 2016, course reading)
- https://www.rstudio.com/
- https://cran.r-project.org/
- https://git-scm.com/

Course literature...

Course literature...

- Matloff, N. The art of R programming [online]
- Wickham, H. Advanced R [online]
- Wickham, H. R packages [online]
- Gillespie, C. and Lovelace, Efficient R programming [online]
- Google search, fora, ...
- ...and articles.

Examination

Weekly mandatory labs/projects, deadline: After corresponding lecture and seminar (for labs 3–6) stated on lab/LISAM

Computer exam points A:[18, 20], B:[16, 18), C:[14, 16), D:[12, 14), E:[10, 12), F:[0, 10)

Bonus points

Bonus points

Computational complexity session bonus point can be obtained by correctly solving all the exercises. Solutions to **all** exercises should be e-mailed to krzysztof.bartoszek@liu.se **prior** to the session. Then, students (from those that e-mailed their solutions) will be selected at random for each exercise to present their solutions. Failure to present a correct solution will result in no bonus point from this session. In particular this implies that the student who wants the bonus point has to be present at the session (live or via Zoom).

Bonus point also for correctly solving bonus lab session "Machine Learning"

Why R?

The One main reason

Choose the right tool for the job!

The One main reason

Choose the right tool for the job!

Your main job will be statistics and data analysis... R is (nearly always) the right tool for that job!

Pros

- Popular (among statisticians)
- Good graphics support
- Open source all major platforms!
- High-level language focus on data analysis
- Strong community vast amount of packages
- Powerful for communicating results
- API's to high-performance languages as C/C++ and Java

Cons

- "Ad hoc", complex, language (Compare Perl, Awk, Sh...)
- Can be slooooow
- Can be memory inefficient
- (Still) Hard'ish to troubleshoot (but ...)
- (Still) Inferior IDE support compared to state of the art (but ...)

Pros/Cons

- Niche language
- Specialized syntax
- Very permissive (changing for packages on CRAN)
- Troubleshooting: no (?) need to investigate memory
- (Still) Inferior IDE support compared to state of the art

Variable types

Variable type	Short	typeof()	R example
Boolean	logi	logical	TRUE
Integer	int	integer	1L
Real	num	double	1.2
Complex	cplx	complex	0+1i
Character	chr	character	"I <3 R"

Variable types

	Variable type	Short	typeof()	R example	
	Boolean	logi	logical	TRUE	#
	Integer	int	integer	1L	
Coersion	Real	num	double	1.2	Coersion
	Complex	cplx	complex	0+1i	
\downarrow	Character	chr	character	"I <3 R"	\Downarrow

Data structures

Dimension	Homogeneous data	Heterogeneous data
1	vector	list
2	matrix	data.frame
n	array	

- Constructors: vector() list() ...
- Name dimensions: dimnames()

Arithmetics

- Vectorized operations (element wise)
- Recycling
- Statistical functions

See reference card...

In symbols	Α	В	$\neg A$	$A \wedge B$	$A \lor B$
In R	Α	A B		A&B	A B
	TRUE	FALSE	?	?	?
	TRUE	TRUE	?	?	?
	FALSE	FALSE	?	?	?
	FALSE	TRUE	?	?	?

In symbols	Α	В	$\neg A$	$A \wedge B$	$A \lor B$
In R	Α	В	! <i>A</i>	A&B	A B
	TRUE	FALSE	FALSE	?	?
	TRUE	TRUE	?	?	?
	FALSE	FALSE	?	?	?
	FALSE	TRUE	?	?	?

In symbols	Α	В	$\neg A$	$A \land B$	$A \lor B$
In R	Α	В	! <i>A</i>	A&B	A B
	TRUE	FALSE	FALSE	FALSE	?
	TRUE	TRUE	?	?	?

```
In symbols \wedge_{i=1}^{N} a_i \quad \forall_{i=1}^{N} a_i \quad \{j : a_j == TRUE\}
In R all(A) \quad any(A) \quad which(A)
```

Relational operators

In symbols
$$a < b$$
 $a \le b$ $a \ne b$ $a = b$ $a \in b$
In R $a < b$ $a <= b$ $a! = b$ $a == b$ $a \% in \% b$

Vectors: Use []

- index by:
 - positive integers: include element(s)
 - negative integers: exclude element(s)
 - logical: include TRUEs

```
vect <- c(6,7,8,9)
> vect[vect>7]; vect[which(vect>7)] ##difference?
[1] 8 9
[1] 8 9
> vect[1:2]
[1] 6 7
> vect[c(1,2)]
[1] 6 7
> vect[c(-1,-2)]
[1] 8 9
```

Matrices

- Use [,]
- Two dimensions
- Index as vectors
- Can reduce (drop class) to vector
- Use [,,drop=FALSE]

Matrices

```
> mat <- matrix(c(1,2,3,4,5,6),nrow=2)
> mat
     [,1] [,2] [,3]
[1,] 1
           3
                5
[2,] 2 4
> mat[c(1,2),c(1,2)]
     [,1] [,2]
[1,] 1
[2,] 2
> mat[c(1,2),]
     [,1] [,2] [,3]
[1,] 1
            3
                5
[2,]
                6
> mat[mat>4]
[1] 5 6
```

Lists

- Use [] to access list elements
- Use [[]] to access list content
- Index as vectors
- Use \$ to access list element by name
- Not like typical lists in other programming languages
- What if name of element sits inside a variable?

Lists

```
> lst <- list(a=47,b=11)
> lst[1]
$a
[1] 47
> lst[[1]]
[1] 47
> lst$b
[1] 11
> x<-"a";lst[which(names(lst)==x)]</pre>
$a
[1] 47
> lst[[which(names(lst)==x)]]
[1] 47
                                 4日 > 4周 > 4 目 > 4 目 > 目 =
```

Data frames

- Very powerful data structure
- Can roughly think about it as the R representation of a CSV file
- Can be loaded from a CSV file
- Can be accessed both as a matrix and a list
- Be careful: picky data structure

Assigning subsets

- Change values in data structures
- Works for all above mentioned data types

Assigning subsets

Functions

```
my_function_name <- function(x, y){
    z <- x^2 + y^2
    return(z)
}</pre>
```

Unlike in many languages, return in R is a **function**. In other languages, return is usually a **reserved word** (like if). This means you must use return as a function call with parenthesis. By default R returns the last computed value of the function, so return is not strictly necessary in simple cases. What if you have a bunch of nested ifs?

HELP!

?

help(function_name)

The End... for today.

Questions?

See you next time!
